

# Pavers and driveway treatment

## Time to Work and Products

We combine two different herbicides when applying a general weed treatment. One is a penetrate product that forces itself into the plant and the second is a non-selective product we are all familiar with, glyphosate.

We use a commercial grade version of glyphosate that is far more effective than over the counter products. This, along with our highly trained application methods ensure that there is no damage to your ornamental garden plants.

The product can take up to 4-6 weeks to fully control the weeds. Normally after about two weeks things will start to die.

## What Does it Kill?

This treatment will kill every single weed that was sprayed. It won't however kill moss and algae. We don't treat near vegetable gardens unless requested.

## People/Pets and Drying Time

The treated areas are safe to be used once the product has dried and has been absorbed by the weeds. This can take between 1 - 4 hours, depending on the weather that day. Please make sure paved areas are dry before enjoying them. Please use common sense.

## Weather

The combination of products we use on general weeds is very effective, even where rain may be expected. The treatments generally only need 30 minutes without rain for the treatment to be successful.

## Will They Come Back?

Pavers and pathways are likely to get weeds annually when they are getting watered from rain or reticulation. If you don't stay on top of weeds you can expect them to come back over time. Remember, we are dealing with nature here!

*Allow 6 weeks to see the progress of our pavers treatment.*

*Treated pavers are safe for use after 1 - 4 hours drying time.*

*We don't treat near vegetable gardens unless requested.*
